

Intervention(s): Random assignment to 1 of 3 groups: fluid restriction alone (FR), fluid restriction and furosemide (FR+FM), or fluid restriction, furosemide, and NaCl (FR+FM+NaCl). Strictness of fluid restriction (<1,000 or <500 mL/d) was guided by the urine to serum electrolyte ratio. Furosemide dosage was 20 to 40 mg/d. NaCl supplements were 3 g/d. All treatments were continued for 28 days.
